 Make sure that the RC return at input terminal has been in a stable state completely (higher than 1 s) before accurate measurement;  
 Input >300 Vrms (or >5 Arms) will cause the self heating of the signal conditioning component to generate error, this error is included in the characteristics of the instrument. Internal temperature variation results from the self heating will cause additional an error on ac range that is lower than 0.03% of readings, and it will disappear after a few minutes

Frequency and Period
Measurement Method: Reciprocal-counting technique, AC-coupled input, AC voltage or AC current measurement function
Measure Attentions
Generally, errors are leaded into all frequency counters when measuring low voltage or low frequency signal. Shielding input can extremely help to reduce measuring errors caused by exterior noise
Setup Time Attentions

If the variational DC components appeared in signals under measure, errors may be caused while measuring period or frequency. Please ensure that the RC loop at input terminal must be stable during exact measuring (higher than 1 sec)
